Tariff Cuts, Uneven Gains

Income after tariff reforms in eight countries.
Mixed evidence, economic liberty and lessons for Nepal.

RESEARCH QUESTION

After tariff-cutting episodes in India, China, Mauritius, Thailand, the Philippines, Pakistan, Côte d'Ivoire and Senegal during 1991–1998, did real GNI per person grow faster over the next ten years than before reform and than other countries—and what does this suggest for Nepal?

Suwarna Pyakurel · Descriptive, reproducible policy research

STUDENTS FOR LIBERTY
A FREER FUTURE

Why tariffs—and how this study was built

Tariffs fund government and protect some producers, but can raise household prices and business costs. I chose this topic to connect a measurable policy change with income and freedom to trade.

FRASER EFW

Raw mean tariff (%) for policy screening; chain-linked Area 4 (0–10) for broader institutional context.

UNDP HDR25

Real GNI per person, 2021 PPP dollars; supplied income histories cover 1990–2023.

Inspect data → document reforms → compare income → test sensitivity → one Nepal proposal

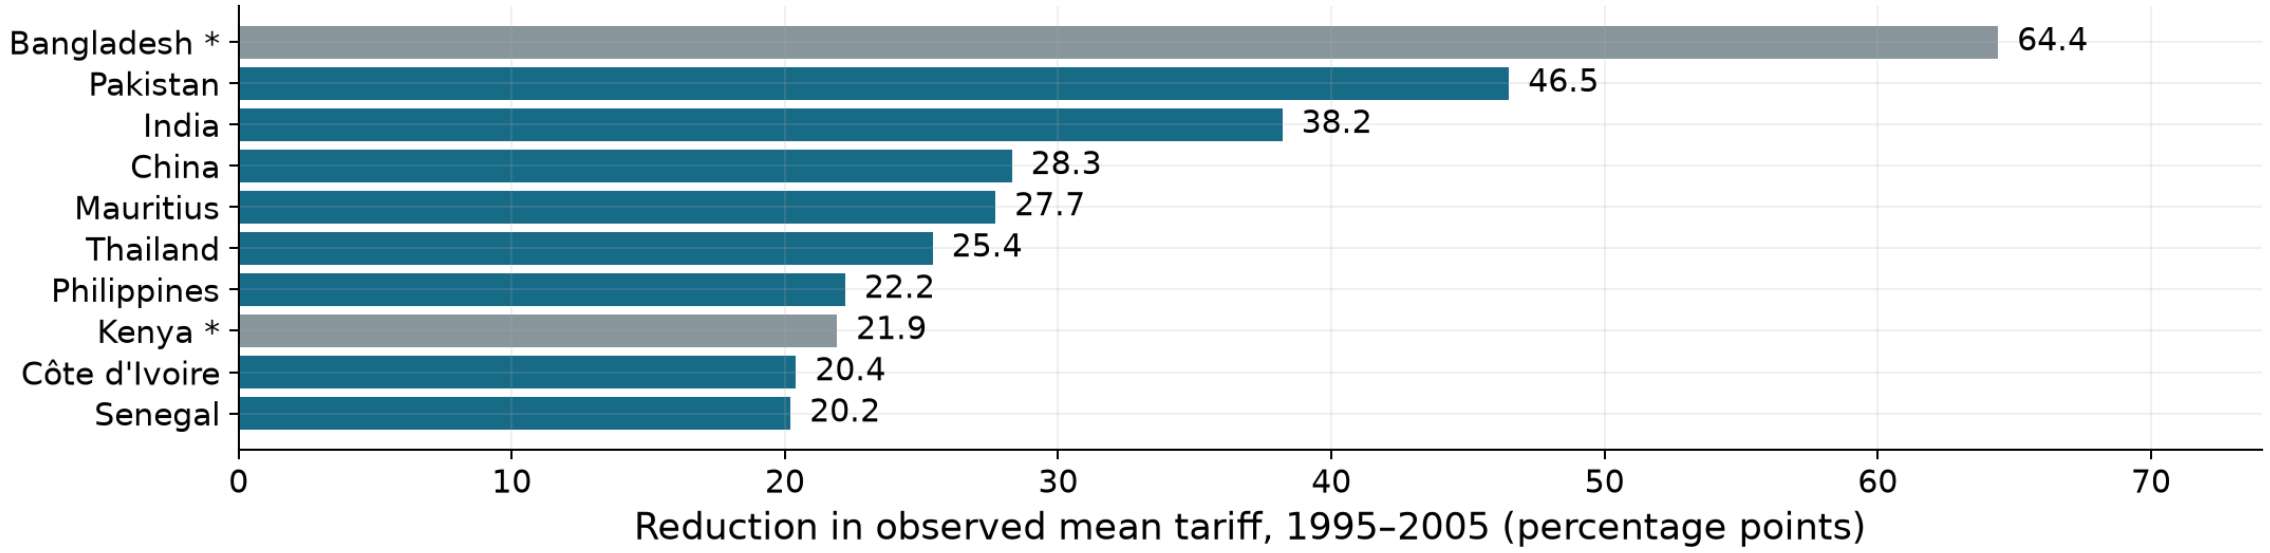

AI assistance: OpenAI Codex helped with research, code, figures, checks and drafting. Suwarna Pyakurel remains responsible for reviewing and explaining the work. Full disclosure: Appendix A4.

Descriptive comparisons—not an estimate of what tariff cuts caused.

STUDENTS FOR LIBERTY
A FREER FUTURE

Ten countries passed the same tariff screen

Figure 1. All ten countries meet the same tariff-reduction rule

Fraser EFW Ratings, raw mean tariff, 1995 and 2005; n=10 of 98 eligible countries. Bar origin=0.
*Bangladesh/Kenya: no precise main tariff-event date; excluded from eight-case main analysis, retained in timing checks.

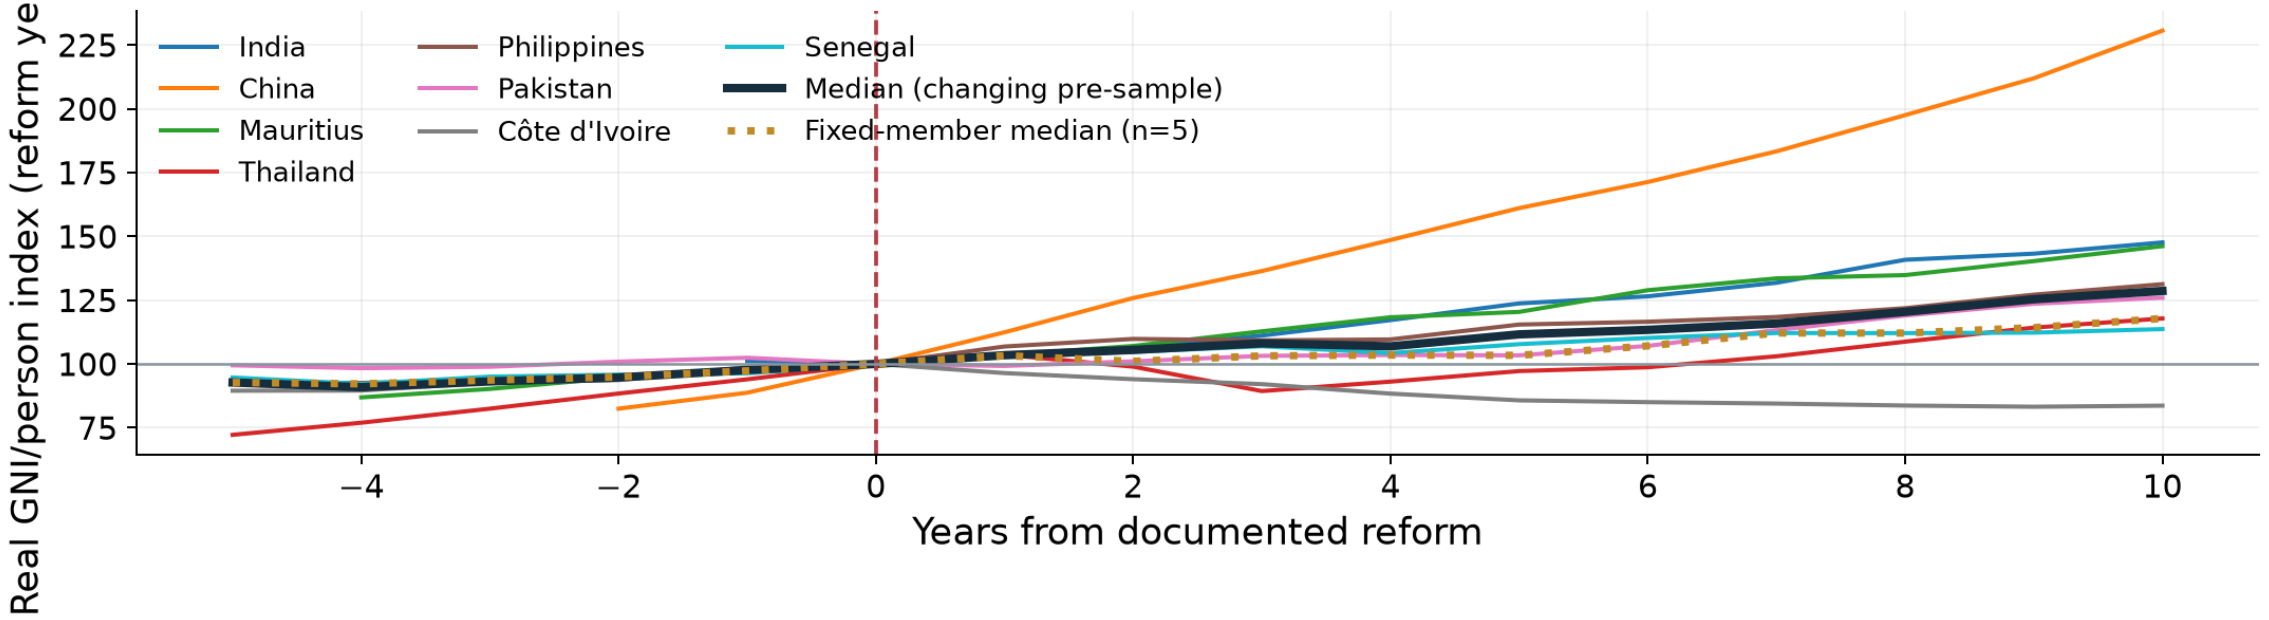

Documented reforms: IND1991 · CHN1992 · MUS1994 · THA/PHL1995 · PAK1997 · CIV/SEN1998

Screen: mean tariff fell ≥20 pp in 1995–2005. Eight dated cases; BGD/KEN timing uncertain.

STUDENTS FOR LIBERTY
A FREER FUTURE

Income rose in seven of eight cases

Figure 2. Income rose in seven of eight cases over ten years

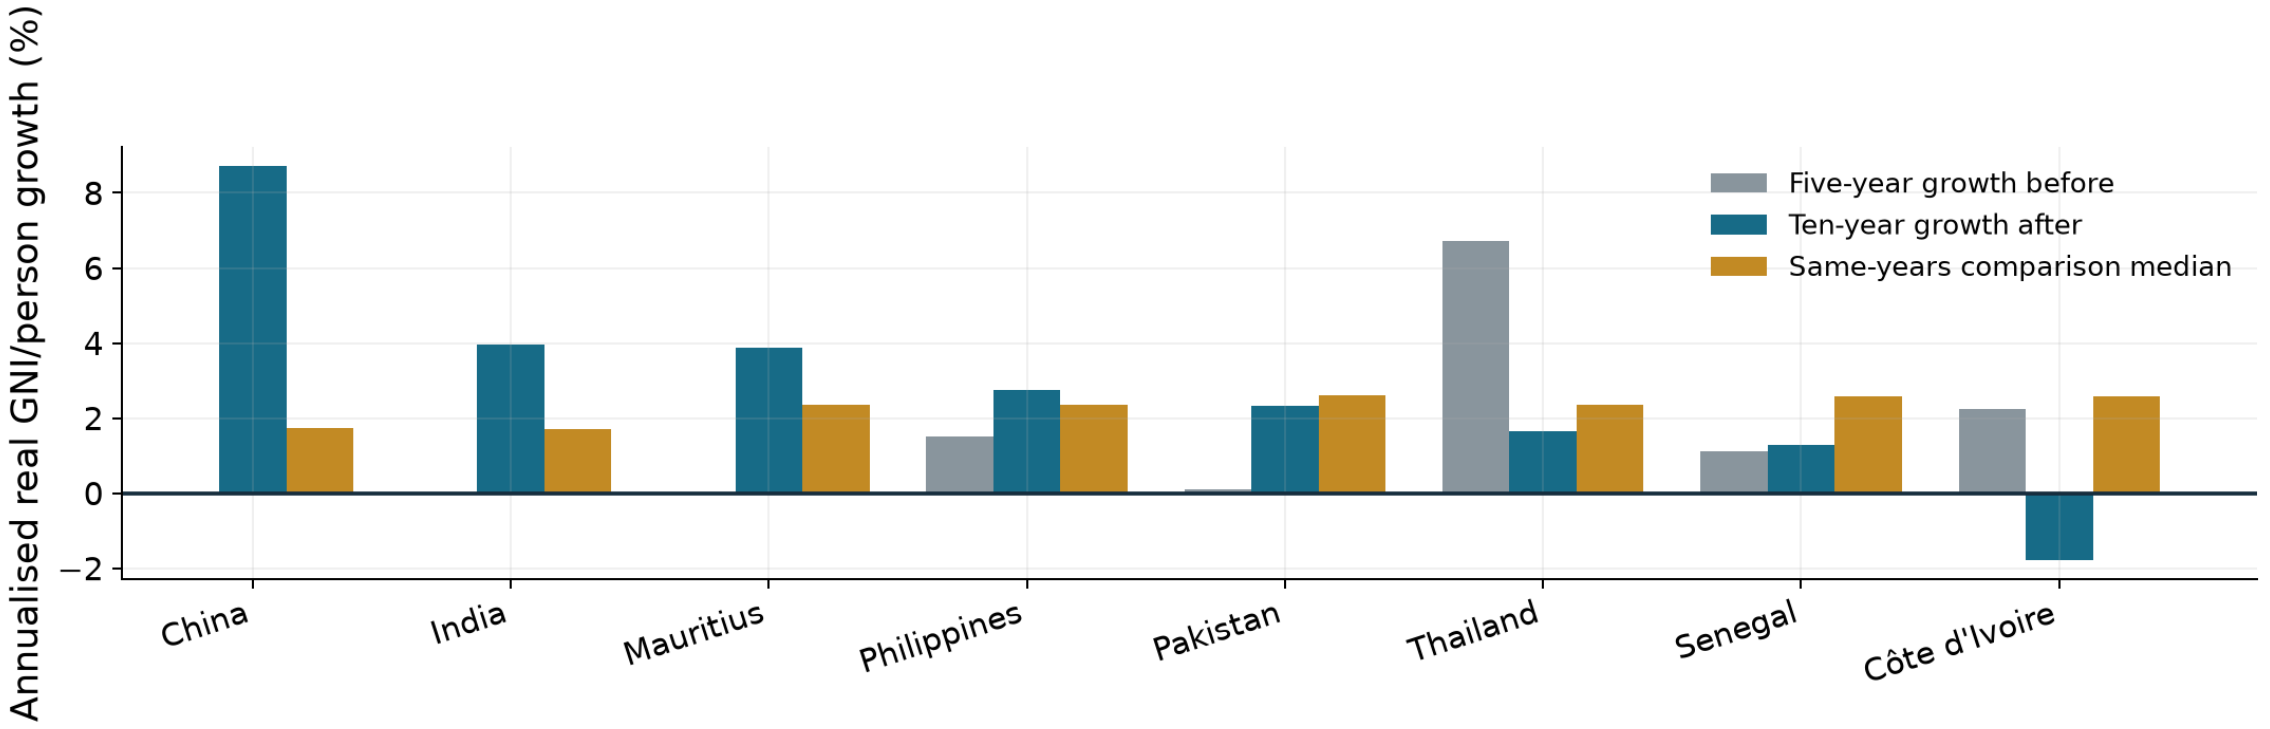

UNDP HDR25; event −5 to +10, observed calendar years 1990–2008; n=8 after reform, 5–8 before.
BGD/KEN: separate timing checks. All series equal 100 at zero by construction; medians do not identify a causal effect.

Reform year = 100 by construction. Dotted median: same five countries; dark median: changing pre-sample.

STUDENTS FOR LIBERTY
A FREER FUTURE

Growth accelerated in three of five complete cases

Figure 3. Growth accelerated in three of five complete comparisons

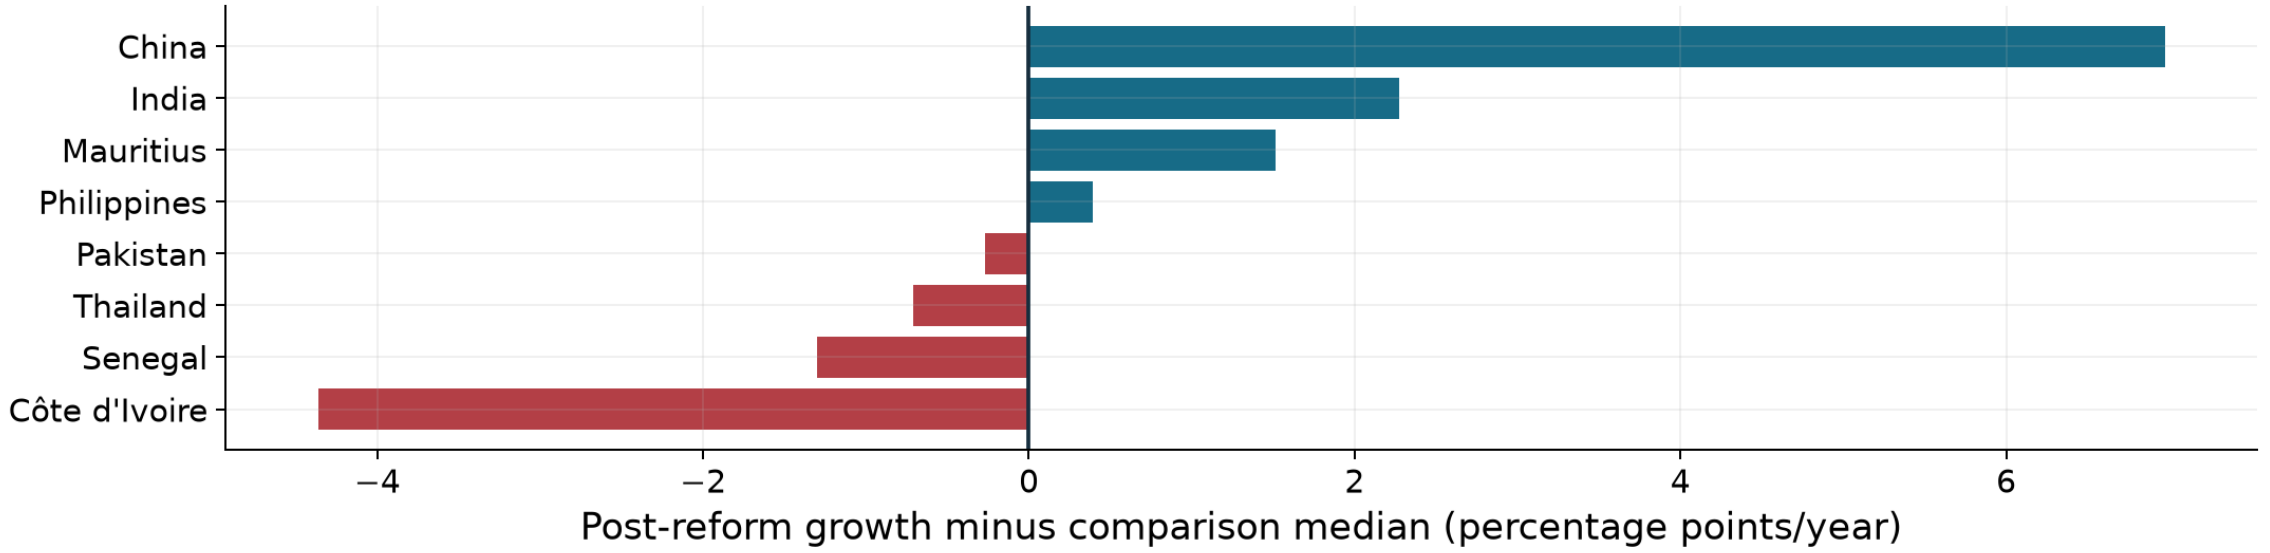

UNDP HDR25; reforms 1991–1998; ten-year endpoints 2001–2008; n=8, complete five-year prehistory n=5.
Missing grey bars=unavailable, not zero. Benchmark n=148–152; all ten screened countries excluded. Bars start at zero.

Benchmark: median growth of other valid countries over the same years; all ten screened cases excluded.

Half outperformed; the median gap was near zero

Figure 4. Half exceeded the benchmark; the median gap was near zero

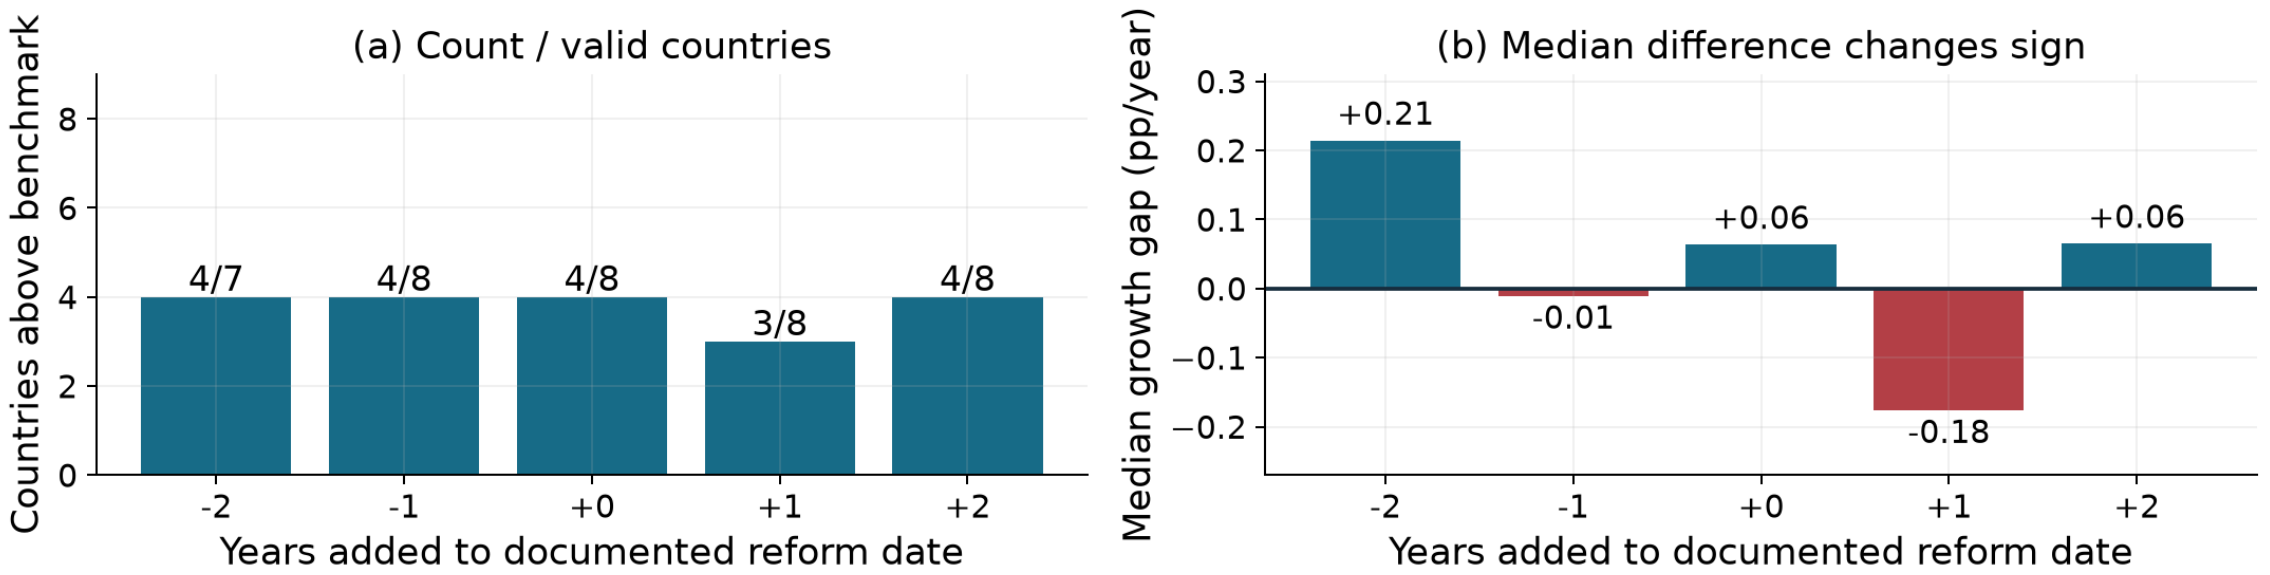

UNDP HDR25; ten-year windows beginning 1991–1998; n=8; median gap +0.06 pp/year. Bars start at zero.
Red=below benchmark, not necessarily falling income. BGD/KEN: timing checks only. CIV/SEN share a regional reform.

Four above, four below. +0.06 pp/year is near zero and sensitive—not a reliable growth premium.

STUDENTS FOR LIBERTY
A FREER FUTURE

Timing and composition change the conclusion

Figure 5. Small timing changes reverse the median comparison

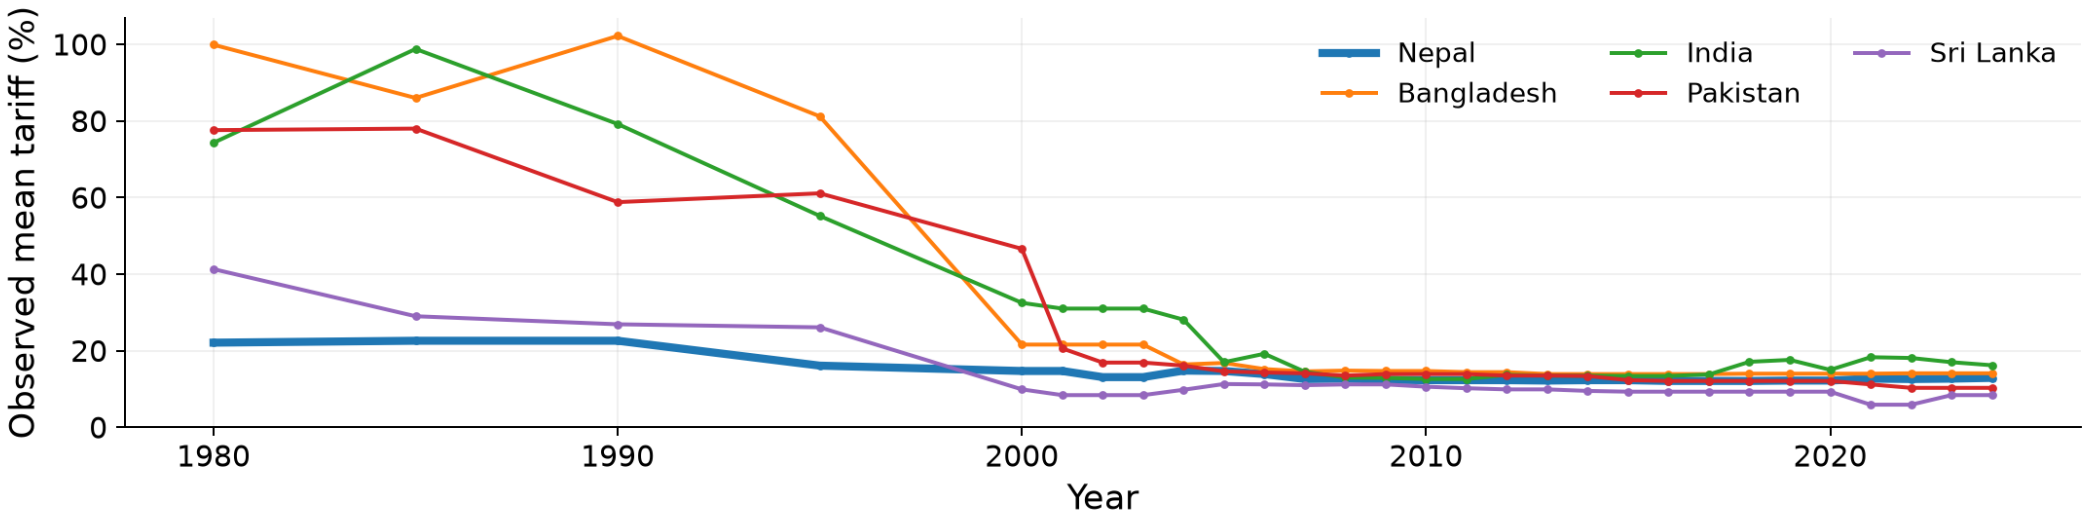

UNDP HDR25; ten-year windows, shifted reform years 1989–2000; n=7–8 valid cases. Bars start at zero.
−2 omits one unavailable income start; counts use valid cases. Complete sensitivity results: outputs/robustness.csv.

Without China: 3/7 above; median −0.27 pp/year. Wider reforms, crises and conflict remain alternatives.

STUDENTS FOR LIBERTY
A FREER FUTURE

Nepal starts from a different tariff position

Figure 6. Nepal began from a different tariff position

Fraser EFW Ratings, raw mean tariff, observed 1980–2024; n=5 regional peers; thick line=Nepal; 2024 mean=12.9%.
Historical context only. A mean is not a statutory maximum, a current rate schedule, or a fiscal-impact estimate.

Proposal: cap standard non-preferential ad valorem basic duties in HS25–97 at 20% over three budgets; retain existing lower rates.

Target remaining high duties—not a 20% average. Figure 6 provides context, not an optimal rate.

STUDENTS FOR LIBERTY
A FREER FUTURE

Nepal modification: rule, authority and mechanism

RULE AND SCOPE	Amend Schedule 1 of the Customs Tariff Act 2081, as amended. Cap standard non-preferential ad valorem basic duties in HS25–97 at 20%; retain lower rates. Phase in over three budgets.
AUTHORITY AND MECHANISM	Finance Ministry proposes → Parliament enacts → Customs administers. Lower affected duties reduce the import-tax wedge; competition and pass-through determine effects on input costs, prices and choice.
OWN FIGURE EVIDENCE	Figure 1 documents tariff reductions; Figures 2–5 show mixed income outcomes; Figure 6 shows Nepal's different starting point. They inform a targeted policy judgement, but do not establish the 20% cap or predict its benefits.

20% and three budgets are proposed choices. VAT, excise, specific/mixed duties and preferences are outside scope.

Wider choice—with the costs stated openly

THE LIBERTY CASE

People should have wider freedom to exchange under predictable rules. Protection concentrates benefits among selected producers while spreading costs across households and businesses buying imports.

THE STRONGEST OBJECTION

Revenue may fall, putting public-service funding under pressure. Protected firms and workers may face concentrated losses. Phasing changes timing; it does not remove these costs.

Income usually rose; growth advantages were mixed. The Nepal cap is a cautious policy judgement—not a promise of faster growth or self-financing gains.

Thank you.
Let evidence guide policy, and let people choose.

Assisted with dataset inspection, coding and debugging, public-source research, charts, reproducibility checks, documentation, slide text and presentation assembly. Suwarna Pyakurel remains responsible for reviewing and explaining the submitted work. Solo entry.

WHAT THE READING ADDS

Baunsgaard & Keen (2005): revenue recovery can be difficult. Agbeyegbe et al. (2004): outcomes depend on import responses and macroeconomic conditions. Neither estimates Nepal's gains or validates 20%.

SOURCE AND LEGAL QUALIFICATIONS

Original sources: accessed 16 October; research papers: 22 October. Automated rechecks on 22 October: 15 HTTP successes, five failures/blocks. Nepal legal evidence is archived as of 16 October; current completeness is unconfirmed.

Laffer intuition does not establish Nepal's revenue peak, an optimal tariff, or that cuts would finance themselves.

Pending: declaration approval, dataset scope/release acceptance, exact deadline and upload limits. No approval, submission or score is claimed.
